

Prompt-Build a platform to donate , lend or sell old book and sell or donate notes
CTOBuddy-

8. MVP Tip (Very Important)

Do NOT build everything at once.

Start with only:

- ✓ Upload books
- ✓ Browse books
- ✓ WhatsApp contact

That alone is already useful.

Chatgpt-

MVP (Minimum Viable Product)

Do NOT build everything first.

Build only:

Phase 1

- Login
- Upload books
- Upload notes
- Search
- Contact seller

That alone is enough to launch.

Comparison-

CTOBuddy is giving me a roadmap to solve the problem using no-code tools, making things as simple as possible. ChatGPT, on the other hand, is giving me a roadmap to turn this platform into a startup. It is also suggesting revenue models for the platform and guiding me on how real startups and platforms are built using React, Firebase, and Supabase.

Answers -

- ChatGPT worked better for long-term planning and startup-level thinking, while CTOBuddy was better for simplifying the development process and giving faster no-code solutions. The main difference was that CTOBuddy focused more on building the product quickly and easily, whereas ChatGPT focused more on scalability, business models, real-world startup structure, and modern development practices using technologies like React, Firebase, and Supabase.
- One limitation I noticed in CTOBuddy was that it relied heavily on no-code approaches, which can become restrictive when building advanced or scalable features. It also lacked deeper guidance on startup strategy, revenue generation, system architecture, and how production-level platforms are actually developed in the real world.
- If I could improve CTOBuddy, I would make it more balanced between no-code simplicity and real development practices. I would add guidance for scalable architectures, startup growth strategies, monetization models, database design, and modern full-stack technologies. I would also improve its ability to explain why certain technical decisions are made instead of only suggesting quick solutions.
